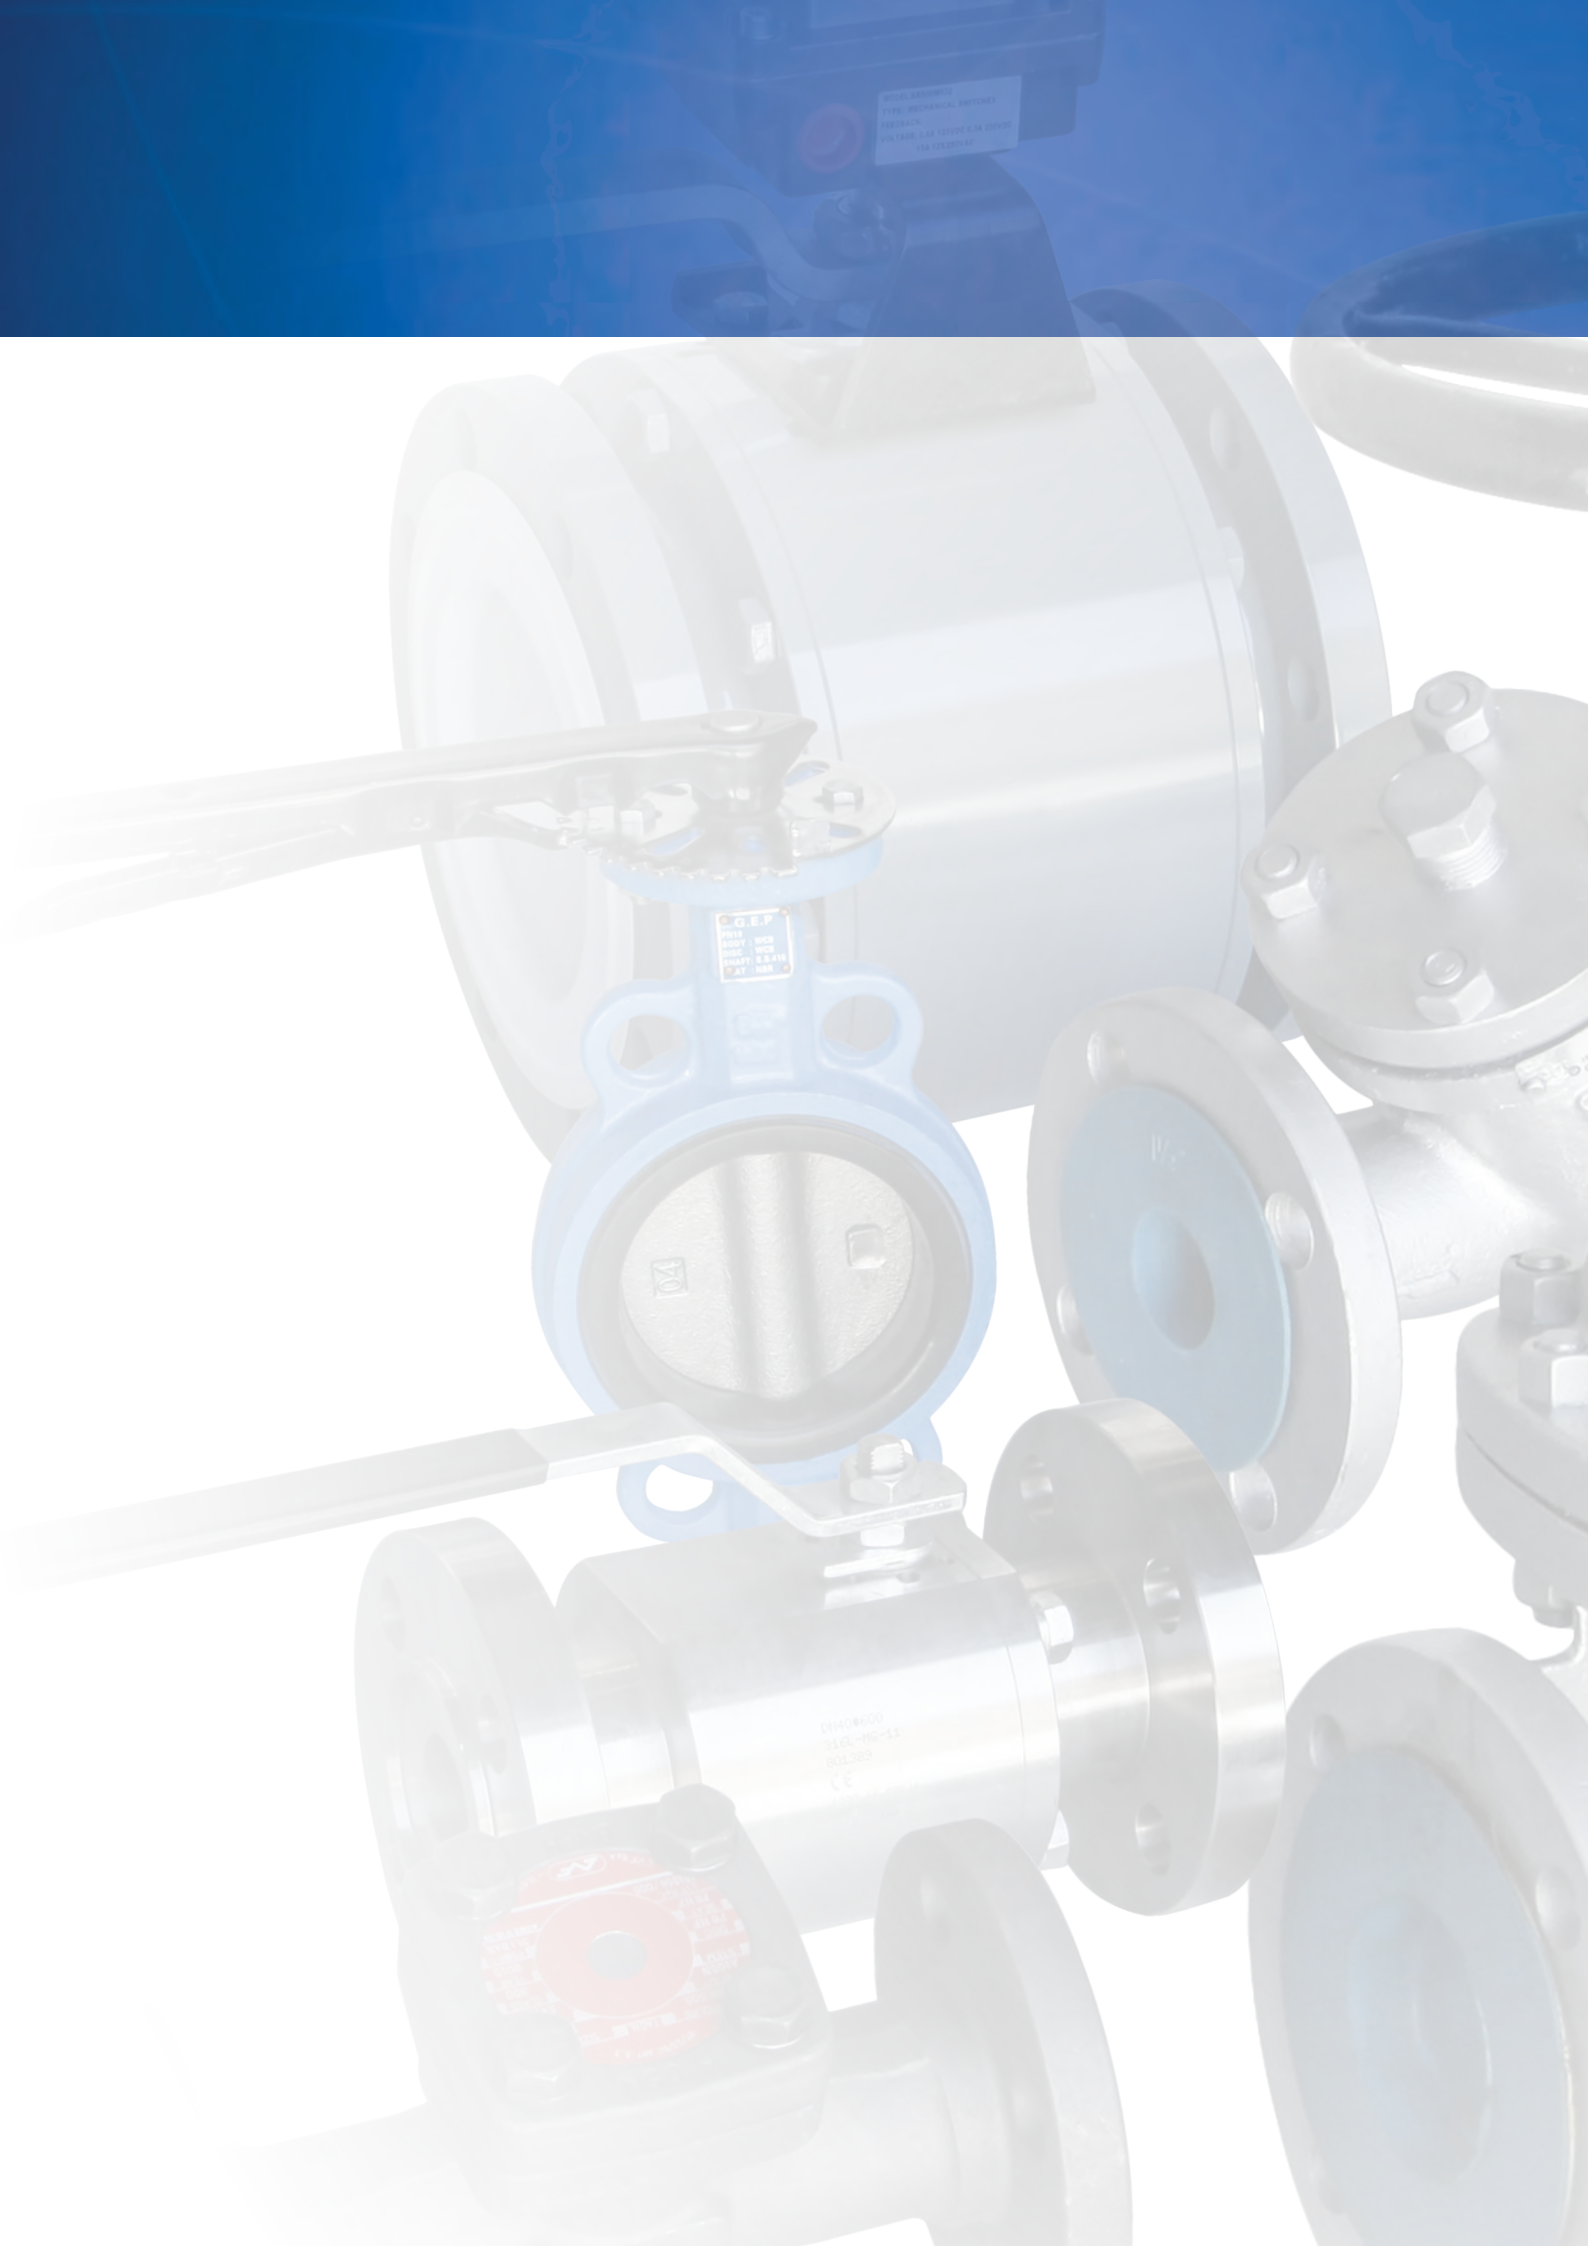
Valves catalogue

Industrial valves since 1996

G.E.P. VALVES



The company

G.E.P. VALVES has been operating on the valve supply market for the last twenty years, achieving excellent results and a very high level of customer satisfaction.

The company started out life in 1996 in Busalla, a town not far from Genoa. The business grew quickly and a few years ago G.E.P. VALVES moved to its present location, enlarging its structure and with additional space for further expansion of its product range.

Today, GEP VALVES offers one of the widest ranges of valves, actuators and ancillary equipment in Italy and invests in its capabilities to meet the needs of most industries.

G.E.P. VALVES policy is to supply products sourced from quality-assessed European manufacturers in compliance with EU and international standards. Where and when required, products will be CE marked, ATEX certified and PED approved.

G.E.P. VALVES

STEEL GATE VALVE

Standards

Design and Manufacture:	API 600 (ISO 10434) or API 6D
Test and Inspection:	API 598, API 600 or API 6D.
End flange dimension:	ASME B16.5 (for NPS≤24); ASME B16.47 series B, API 605 or ASME B16.47 series A, MSS SP-44 (for NPS >24).
BW end dimension:	ASME B16.25.
Face to face (end to end):	ASME B16.10.
Pressure-temperature ratings:	ASME B16.34.

STEEL GATE VALVE

Standards

Design and Manufacture: Cast steel gate valve to API 600 (ISO 10434) or API 6D; Cast stainless steel gate valve to API 603 or API 600; Forged steel gate valve to API 602.
Inspection and Test: API 598, API 600 or API 6D.
End flange dimension: ASME B16.5 (for NPS≤24); ASME B16.47 series B, API 605 or ASME B16.47 series A, MSS SP-44 (for NPS >24).
BW end dimension: ASME B16.25.
Socket-weld dimension: ASME B16.11.
Face to face and end to end: ASME B16.10.
Pressure-temperature ratings: ASME B16.34.

Design of disc

Gate valves with NPS ≥ 2 are of wedge flexible gate;
Gate valves with NPS < 2 are of wedge solid gate.

Body and Bonnet Connection

The body and bonnet of Class150~Class900 gate valves are usually connected with studs and nuts. And the body and bonnet of Class1500~Class2500 gate valves are usually of pressure seal design.

Gasket of Cover Flange

Carbon steel or stainless steel + flexible graphite combined gasket is used for Class150 gate valve; Stainless steel + flexible graphite wounded gasket is used for Class 300 gate valve; Stainless steel + flexible graphite wounded gasket is used for Class600 gate valve, and ring joint gasket is also optional for Class600 gate valve; Ring Joint gasket is used for Class 900 gate valve; Pressurized seal design is used for Class1500~Class500 gate valve.

Actuation

Hand wheel or gear box is usually used for gate valve actuation. Chain wheel and electric actuator can be also used for gate valve actuation if being requested by the customers.

Packing Seal

Molded flexible graphite is used for packing material. PTFE or combined packing material can be also used if being requested by the customer. The internal surface of the stuffing box, of which area is contacted with the packing, is of excellent finish (Ra 3.2 μ m). The stem surface, contacting with the packing, should be rolled and pressed after being precisely machined, so as to reach to the high finish and compactness (Ra 0.8 μ m) and ensure the reliable tightness of the stem area.

Back Seating Design

All our gate valves have the back seating design. In most cases, the carbon steel gate valve is fitted with a renewable back seat. For stainless steel gate valve, the back seat is machined directly in the bonnet or is machined after welding. When the gate valve is at fully open position, the sealing of the back seat can be very reliable. However, as per the requirement of API 600, it is not advisable to add or change packing by the mean of back seating when the valve is Pressure containing.

Seat

For carbon steel gate valve, the seat is usually forged steel. The sealing surface of the seat is spray welded with hard alloy specified by the customer. Renewable threaded seat is used for NPS ≤ 10 gate valves, and welded on seat can be also optional if being requested by the customer. Welded on seat is used for NPS ≤ 10 carbon steel gate valves. For Stainless steel gate valve, integral seat is usually adopted, or to weld hard alloy directly integrally. Threaded or welded on seat is also optional for stainless steel gate valve if being requested by the customer.

Stem Design

The stem is of integral forged design. The minimum diameter of the stem shall per the standard requirement. The connection of the stem and disc is T type. The strength of the connecting area is bigger than that of the T threaded part of the stem. The strength test of that area conforms to API 591.

Stem Nut

Usually, the stem nut is made of copper alloy. It is also can be made of ASTM A439 D2 if being requested by the customer. For large sized gate valves (NPS 10 for Class 150, NPS 8 for Class 300, NPS 6 for Class 600, NPS 5 for Class 900), rolling bearing is fitted at the two sides of the stem nut in order to minimize the open and close torque of the gate valve.

Special Gate Valve

Besides the common gate valves, G.E.P. Valves also supplies Cryogenic Gate Valve, Jacketed Gate Valve, Bellow Sealed Gate Valve, Extension Stem Gate Valve for underground application, Slat Gate Valve, etc.
Our market includes also UNI gate valves as per EN12516-1 design; please contact us for more information.

STEEL GLOBE VALVE

Standards

Design and Manufacture:	Cast steel globe valve to BS 1873 and ASME B16.34; Forged steel globe valve to API 602.
Inspection and Test:	API 598.
End flange dimension:	ASME B16.5.
BW end dimension:	ASME B16.25.
Socket-weld dimension:	ASME B16.11.
Face to tace and end to end:	ASME B 16.10.
Pressure-temperature ratings:	ASME B16.34.

STEEL GLOBE VALVE

Standards

Design and Manufacture: Cast steel globe valve to BS 1873 and ASME B16.34;
Forged steel globe valve to API 602.
Inspection and Test: API 598.
End flange dimension: ASME B16.5.
BW end dimension: ASME B16.25.
Socket-weld dimension: ASME B16.11.
Face to tace and end to end: ASME B 16.10.
Pressure-temperature ratings: ASME B16.34.

The features of globe valve

Bolted Bonnet; Outside Screw and Yoke; Rising stems; Metallic seating surfaces.

Body and Bonnet Connection

The body and bonnet of Class 150 - Class 900 globe valves are usually with studs and nuts. If being requested by the customer Class 600 and Class 900 can be pressure seal design as usually used for Class 1500 - Class 2500.

Gasket of Cover Flange

Stainless steel + flexible graphite wounded gasket is used for Class 150 and Class 300 globe valve. Stainless steel + flexible graphite wounded gasket is used for Class 600, and ring joint gasket is also optional for Class 600. Ring joint gasket is used for Class 900 globe valve. Pressurized seal design is used for Class 1500 - Class 2500 globe valve.

Actuation

Hand wheel, impact hand wheel & gear box is usually used for globe valve actuation. Chain wheel and electric actuator can be also used for globe valve actuation if being requested by the customers.

Packing Seal

Molded flexible graphite is used for packing material. PTFE or combined packing material can be also used if being requested by the customer. The internal surface of the stuffing box, of which area is contacted with the packing, is of excellent finish (Ra 3.2 μ m). The stem surface, contacting with the packing, should be rolled and pressed after being precisely machined, so as to reach to the high finish and compactness (Ra 0.8 μ m) and ensure the reliable tightness of the stem area.

Back Seating Design

All our globe valves have the back seat design. In most cases, the carbon steel globe valve is fitted with a renewable back seat. For stainless steel globe valve, the back seat is machined directly in the bonnet or is machined after welding. When the globe valve is at fully open position, the sealing of the back seat can be very reliable. However, as per the requirement of API, it is not advisable to add or change packing by the mean of back seating when the valve is pressure containing.

Seat

For carbon steel globe valve, the seat is usually forged steel. The sealing surface of the seat is spray welded with hard alloy specified by the customer. Renewable threaded seat is used for NPS ≤ 10 globe valve, and welded on seat can be also optional if being requested by the customer. Welded on seat is used for NPS ≥12 carbon steel globe valves. For stainless steel globe valve, integral seat is usually adopted, or to weld hard alloy directly integrally. Threaded or welded on seat is also optional for stainless steel globe valve if being requested by the customer.

Stem Design

The stem is of integral forged design. The minimum diameter of the stem shall per the standard requirement.

Stem Nut

Usually, the stem nut is copper alloy. It is also can be made of ASTM A439 D2 if being requested by the customer. For large sized globe valve, rolling bearing is fitted at the two sides of stem nut in arder to minimize the open and close torque of the globe valve.

Special Globe Valve

Besides the common globe valves, we also supply cryogenic globe valve, bellow sealed globe valve, Jacketed globe valve, etc.
Our market includes also UNI globe valves as per EN12516-1 design; please contact us for more information.

FORGED STEEL VALVE

Forged steel valves are available in three types of body-bonnet connection.

The first design is the bolted bonnet, with male-female joint, spiral wound gasket, made in F304L/ graphite.
Ring joint gasket are also available on request.

The second design is the welded bonnet, with a threaded and seal welded joint.

On request a full penetration strength welded joint is available.

The third design is the pressure seal bonnet, with a threaded and pressure seal bonnet joint.

All forged valves are also available with integral flanged ends. Class 2500 & Class 4500 are supplied upon customer request. Our market includes Y type globe valves too, please contact us for any further information.

FLOATING BALL VALVE

Standards

Design and Manufacture:	API 6D, ASME B16.34 (BS5351), API 608, MSS-SP-72
Face to face Dimension:	ASME B16.10, API 6D
Flange Connection Dimension:	ASME B16.5
BW Connection Dimension:	ASME B16.25
Fire-safe Design:	API 607/6FA
Anti-static Design & anti Blow-out Stem:	ASME B16.34

FLOATING BALL VALVE

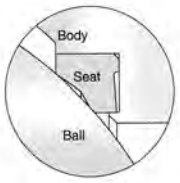
Application

Floating ball valves are suitable for various kinds of pipelines of Class 150 to Class 1500, PN16 to Pn100, and JIS 10K to JIS 20K to turn on or off the pipeline medium, of which the operation types include manual, worm gear and pneumatic or electric actuators.

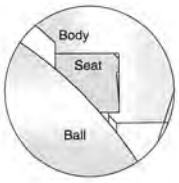
Construction and features of floating ball valve

Reliable seat seal

The structure design of elastic sealing ring has been adopted for floating ball valves. This seat design features a bigger sealing pressure ratio between the ring surface and the ball when medium pressure gets lower, where the contacting area is smaller. Thus, the reliable seal is ensured. When the medium pressure gets higher, the contacting area between seat ring and ball becomes bigger as the sealing ring transforms elastically to undertake the bigger force pushed by the medium without any damage.



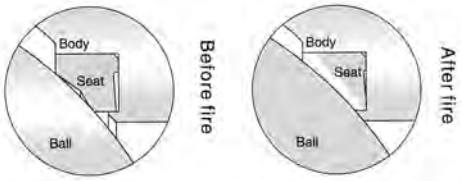
At lower medium pressure



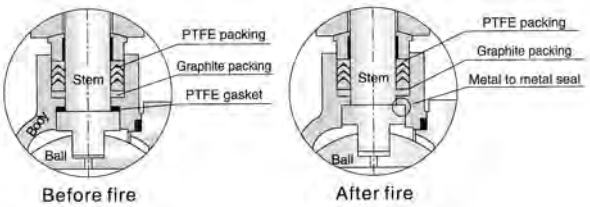
At higher medium pressure

Fire safe design

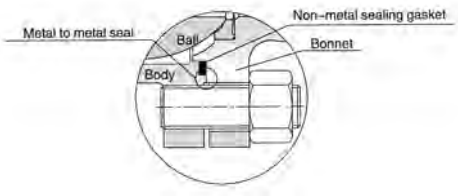
With the valve heated in a fire application, the non-metal material parts such as seat sealing ring of PTFE, stem back seat gasket, gland packing, and the sealing gasket between body and bonnet might disintegrate or be damaged due to high temperature. G.E.P. Valves specially designed structure of auxiliary metal to metal seal is provided to effectively prevent both internal and external leakage of the valve. As required by customers, G.E.P. Valves floating ball valves with design can meet the requirement of API 607, API 6FA,BS 6755 and JB/T 6899.



Fire safe design of seat



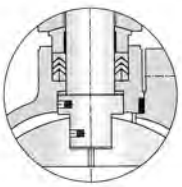
Fire safe design of seat



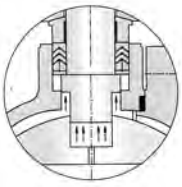
Fire safe design of valve body and bonnet flanges

Reliable stem seal

The blow-out proof design has been adopted for the stem to ensure that even if the pressure in the body cavity is risen accidently and the packing flange becomes invalid, the stem may not be blown out by medium. The stem features the design with a backseat, being assembled from underneath. The sealing force against the backseat gets higher as the medium pressure becomes higher. So the reliable seal of the stem can be assured under variable medium pressure.

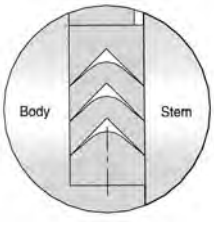


Stem assembled from underneath may not be blown out by medium

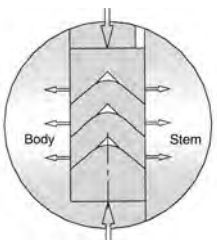


Stem assembled downward may be blown out

V type packing structure has been employed to effectively transform the pushing force of the gland flange and the medium pressure into the sealing force against the stem.



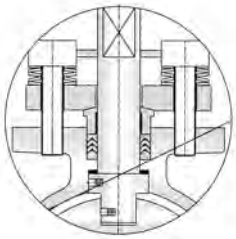
Packing before pressed



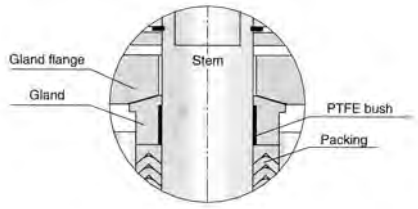
Packing after pressed

FLOATING BALL VALVE

Based on customers' requirement, a packing tightening design may be employed to obtain more reliable stem packing seal, which is loaded by bevelling spring.

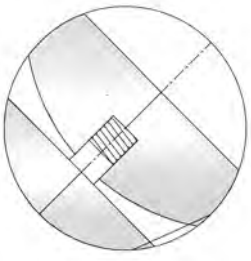


The traditional packing flange design has been improved to be of two piece structure , i.e., being as a gland flange and gland, the latter contacts the gland flange with spherical surface. Thus, the gland remains always vertical, and is lined internally with a PTFE bush to prevent the galling against and friction between the stem, which can also reduce the operation torque of the valve.



Stem galling prevented in application

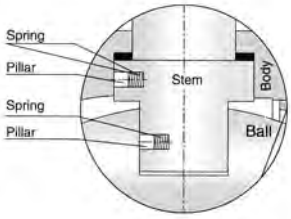
Mounting pad provided



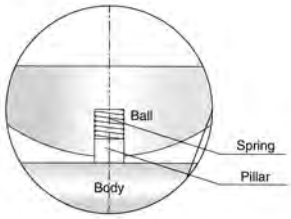
G.E.P. Valves company has provided for floating ball valve with a mounting pad, through which it is easy to fix the actuators, such as worm gear, pneumatic and electric actuators.

Anti-static feature

The traditional packing flange design has been improved to be of two piece structure, i.e., being as a packing flange plate and a follower, the latter contacts the flange plate with spherical surface. Thus, the follower remains always vertical, and is lined internally with a PTFE bush to prevent the galling against and friction between the stem, which can also reduce the operation torque of the valve.



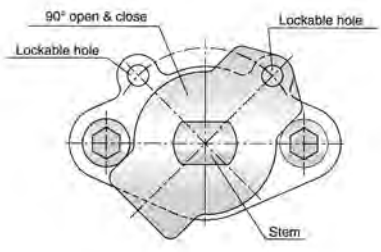
Anti-static design
for ball valve ≥32 mm



Anti-static degisn
for ball valve ≤25 mm

Wrong operation prevention

To prevent the ball valve from wrong operation, the key lock with 90° of open and close positioning pad has been provided, which can be lock able as required. At the stem head, where the lever fixes, a flat is designed so that the valve opens with the lever in parallel to piping, and with the lever right-angled to the piping, the valve is closed. So, it is ensured that the valve indicator of open and close can never make mistake.



FLOATING BALL VALVE

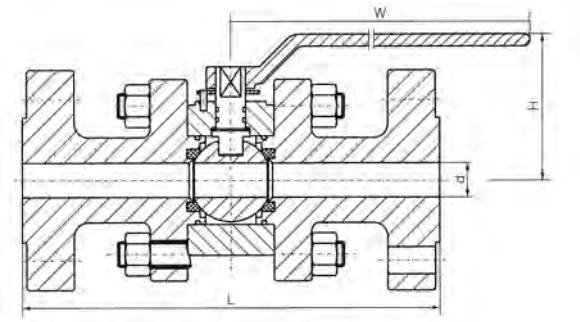
Forged steel ball valve

The floating ball valve supplied by G.E.P. Valves company is generally employing casted steel valve body, however, as required by customers, forged steel valve body is also available, of which the main sizes such as flange connections and face to face dimensions are the same as that of the cast steel ball valve.



Ball valve with reduced bore

In addition to the full bore floating ball valve, G.E.P. Valves is also supplying the floating ball valve with reduced bore to satisfy different customer's requirement, which can not only lower the cost and the pricing, but also meet customers' special requirement.

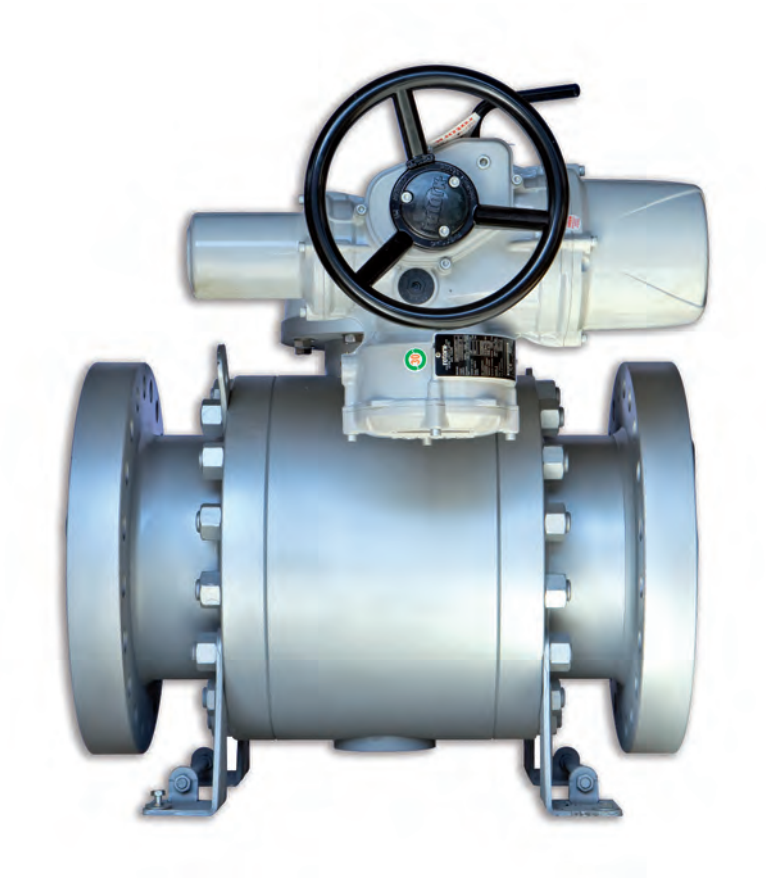
Note: 1. Sizes of flange connection of the ball valve with reduced bore are the same as that of full bore ball valves.
2. There are two series of face to face dimensions, i.e., the long series and the short series, for some of ball valves with reduced bore.

TRUNNION BALL VALVE



Standards

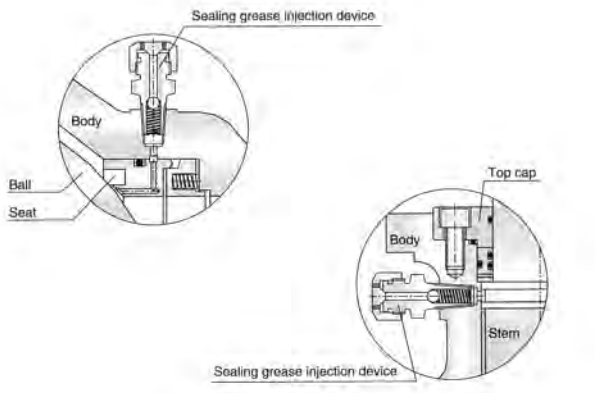
Design and Manufacture:	API 6D, ASME B16.34.(BS5351), API 608, MSS-SP-72
Face to face Dimension:	ASME B16.10, API 6D
Flange Connection Dimension:	ASME B16.5, NPS≥26") PER as ASME B16.47
BW Connection Dimension:	ASME B16.25
Test and Inspection:	API 598, API 6D
Fire-safe Design::	API 607/6FA
Anti-static Design & anti Blow-out Stem	

TRUNNION BALL VALVE

DESIGN FEATURES OF TRUNNION BALL VALVE

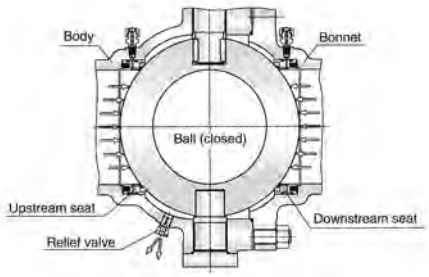
Urgent grease injection device

According to customers' requirement, the trunnion ball valves supplied by G.E.P. Valves company are provided with devices for urgent grease injection, which are on both the stem and seat for the trunnion ball valves of DN > 150mm (NPS6), and in the body cavity for the valve of DN <125mm. When the O ring of stem or the body seat ring is damaged due to accident, the medium leakage between body and stem can be prevented by injecting the sealing grease through the device.



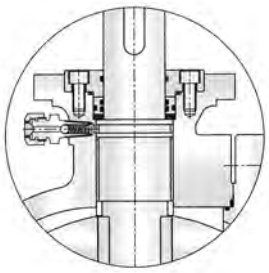
Double-block and bleed functions

In general, G.E.P. Valves trunnion ball valve features the front ball sealing design structure. Each seat of the ball valve can separately cut off the medium at both inlet and outlet of the valve to realize double-block functions. When the ball valve is closed, body cavity and two of the body ends can be blocked with each other even if both the inlet and outlet are under pressure, when the medium left in the body cavity might be bled through the relief valve.



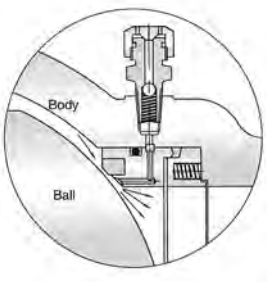
Blow-out proof stem

Blow-out proof structure is provided with for the stem, which is positioned by the up-end cap and screw, being guaranteed not to be blown-out by the medium even if at abnormal risen pressure in the cavity.



Self-relief in the body cavity

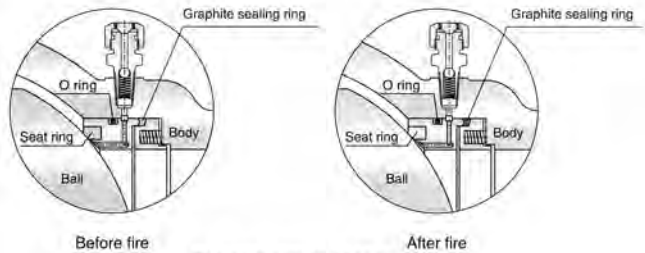
As the liquid medium left in the body cavity gasifies due to increased temperature, the pressure in the body cavity becomes abnormally higher when the medium itself in the cavity would propel the seat and self-relieves the pressure to ensure the safety of valve.



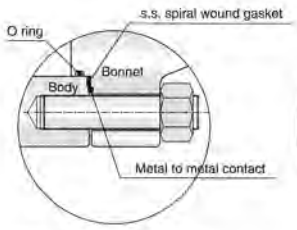
TRUNNION BALL VALVE

Fire safe design

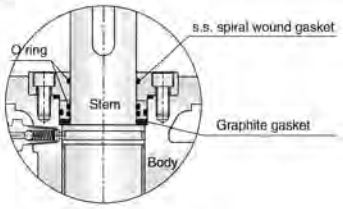
With the valve heated in a fire application, the non-metal material parts such as seat sealing ring of PTFE, O ring for the stem, and sealing gasked for body and bonnet, might be damaged due to high temperature. G.E.P. Valves special design of auxiliary metal to metal or the graphite seal is provided for the trunnion ball valve to effectively prevent both internal and external leakage of the valve. As required by customers, G.E.P. Valves fire safe design for the trunnion ball valve meets the requirements of API 607, API 6Fa, BS 6755 and JB/T 6899.



Fire safe design of seat

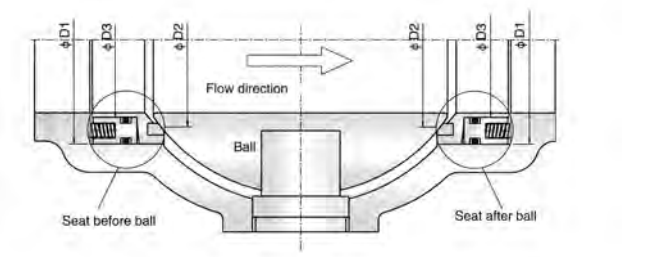


Fire safe design of valve body and bonnet flanges



Fire safe design of stem

The Bi-sealing design structure, i.e. seat sealing in front of the ball and seat sealing behind the ball



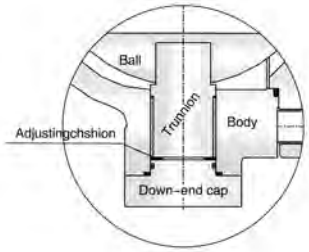
According to some special working conditions and customers' requirement, G.E.P. Valves has provided the trunnion ball valve with the Si-sealing design structure,i.e. seat sealing in front of the ball and seat sealing behind the ball, thus the reliable sealing of the valve is ensured because the valve can perform normally even if one of the effective sealing designs becomes lost due to the abnormal condition.

Regarding the seat in front of the ball , the piston effect formed by the area difference between 01 and 02 ,plus the pre-tightened force of a spring would cause the seat in front of the ball by the pressure difference of the medium before and after the valve to touch the ball closely to form the tightness, of wh ich the sealing force will become bigger as the pressure difference gets higher.

Regarding the seat after the ball, the piston effect formed by the area difference between 02 and 03 ,plus the pretightened force of a spring would cause the seat behind the ball to touch the ball closely to form the tightness, of which the sealing force will become bigger as the pressure difference gets higher.

Anti-static design

The ball of the trunnion ball valve gets close contact with each other through the trunnion, adjusting cushion, and down-end cap, the passage of static electricity thus forms together with the valve, which may lead the static electricity caused by sparks generated by friction between the ball and seat during on and off performance to the ground to prevent the possible risk of fire or explosion.



Mounting pad provided

GEP Valves Company has provided the trunnion ball valve with a mounting pad for fixing the actuators, such as worm gear, pneumatic, electric, hydraulic, and pneumatic & hydraulic actuators.

TRUNNION BALL VALVE

Typical drawing of trunnion ball valve and parts composition

Application

Trunnion ball valves are suitable for use on various kinds of pipelines of Class 150 ~ Class 2500, PN16 ~ PN160, JIS10K ~ JIS20K to cut off or turn on the pipeline medium, of which the operation types include worm gear, manual, pneumatic or electric actuators, being in general of flange connection, and butt welding ends connection as well.

	250	10	1270	1292	1270	223	660	350	600	2080

Note: 1. RF indicates raised flange, RTJ means ring joint flange, and BW is butt welding ends connection.

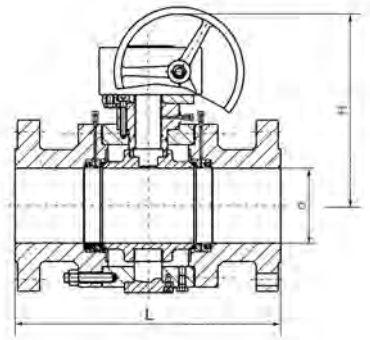
2. Flange dimensions of the above table for valves of NPS ⩽ 24 conforms to ASME B 16.5.

3. For valves of NPS ⩾ 26, the flange dimensions of above table conforms to B series of ASME B16.47 and API 605. As required by customers, flange dimensions may also conform to A series of ASME B16.47 and MSS–SP–44.

TRUNNION BALL VALVE

Forged steel trunnion ball valve

G.E.P. Valves company supplies in general trunnion ball valve of casted steel valve body. However, if required by customers, forged steel valve body is also available, of which the flange dimensions and face to face dimensions are the same as that of cast steel trunnion ball valve.



Ball valve with reduced bore

Except for full bore ball valves, G.E.P. Valves supplies also the ball valve with reduced bore to meet different requirement of customers, which not only lowers the cost and pricing, but also satisfies the special requirement of customers.

METAL TO METAL SEALED BALL VALVE

Brief description

The seat material of general purpose ball valve employs generally non-metal material, such as PTFE. Limited by the seat material, the general purpose ball valve can not be used in case of high temperature application, and application medium with solid articles, and ash dregs neither. So, the application scope of general purpose ball valve is restricted partially. Taking this into consideration, G.E.P. Valves is able to offer a full range of metal to metal sealed ball valve, including floating ball valve and trunnion ball valve, which have found extensive applications in such industries as petroleum, chemistry, power, metallurgy, and light industry.

Design features of metal to metal sealed ball valve

Except for full bore ball valves, G.E.P. Valves supplies also the ball valve with reduced bore to meet different requirement of customers, which not only lowers the cost and pricing, but also satisfies the special requirement of customers.

Advanced hardening technology employed for ball and seat

Metal to metal sealed design has been employed perfectly for the ball and seat, which has also adopted the advanced hardening technologies, such as ultro-sonic spray coating, nickel base spray welding, surface specially hardening, stellite spray welding, ceramic material with high strength and hardness, and so on. Surface hardness of the ball and seat may generally reach more than HRC60, Maximun is up to HRC74, and application temperature of the material may be up to 540°C, Maximun is 980°C. Combining strength of the material gets to more than 10000 PSI. Besides, the surface materials posses also very good resistance properties of friction and impact. Metal to metal sealed ball valves supplied by G.E.P. Valves are suitable for use in most criticle working conditions.

Valve stuck under high temperature prevented

In the case of high temperature working condition, the valve seat and ball would easily get stuck due to heat expansion, and the valve could not be open. Metal to metal sealed ball valves supplied by G.E.P. Valves employ the patented design of bevelling spring loading, which would absorb the heat expansion of parts caused by the bevelling spring. So, it is ensured that the valve would not get stuck and be open and close easily in the case of high temperature condition.

An entire fire safe structure

The metal to metal sealed structure has been adopted for the valve sealing surface design. Packing is so designed with graphite, and gasket is so designed with stainless steel, plus graphite that the valve can assure reliable tightness even if under fire condition.

Excellent tightness function

A unique technique has been employed for the ball grinding, which makes the ball surface reach extreme round and smooth by rotating the ball and grinding apparatus at different directions in space. The tightness function of the valve meets completely and exceeds the standard requirement.

Natural anti-static structure

Metal to metal sealed ball valve with its body seat, ball, other metal parts, and so forth, closely contact with each other, having naturally formed a static electricity passage. In this respect, there is no need to provide special anti-static device.

Double-block and bleed function

G.E.P. Valves's metal to metal sealed trunnion ball valve is in general of the front ball sealing structure. Actually, two seats of the metal to metal sealed trunnion ball valve can both cut off separately the medium at inlet and outlet to realize doubleblock function. When the valve is closed, the body cavity and both the bore ends can be blocked with each other even if both ends of the valve are under pressure at the same time, where as the medium left in the body cavity may relieve through the relief valve.

G.E.P. Valves's metal to metal sealed floating ball valve is of behind ball sealing structure, employing in general single direction tightness. The flow direction is indicated on the valve body.

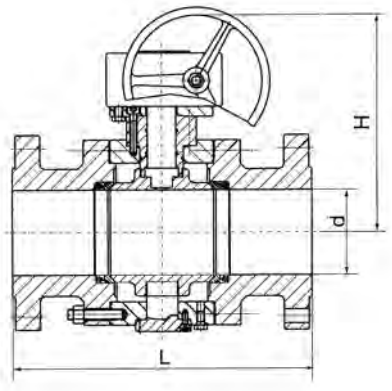
Forged steel metal to metal sealed trunnion ball valve

G.E.P. Valves company's metal to metal sealed trunnion ball valve is in general employing casted steel valve body. As per customers' requirement, forged steel valve body is also available, of which the flange dimensions and face ot face dimensions are the same as that of cast steel trunnion ball valve.

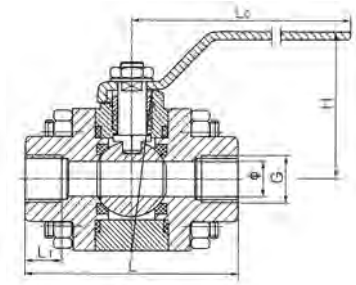


FEMALE THREADED BALL VALVE

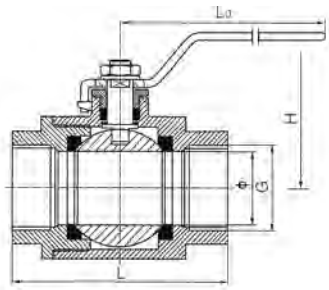
Application

Female threaded ball valves are suitable for use on pipelines of medium or low pressure to turn off or switch on pipeline medium. Operation manners are in general of manual, and pneumatic or electric actuators are available. Based on design structures, the valves get divided into three pieces, two pieces, and one piece types.

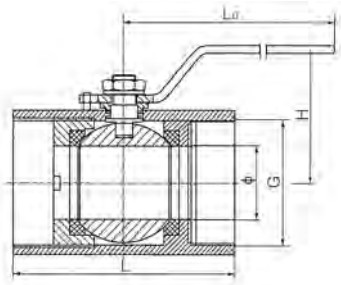
Main sizes and weights



QS11F female
threaded three pieces ball valve



QL11F female
threaded two pieces ball valve



QZ11F female
threaded one piece ball valve

OPERATION TORQUE OF FLOATING BALL VALVE

Operation torque of floating ball valve

The operation torque data of soft sealed floating ball valve in the following table are calculated based on normal temperature and clean medium.
As selecting actuator, it is suggested that drive torque of actuator be more than 1.3 times the operation torque of ball valve at least. In case of high temperature and low temperature working conditions or unclear medium, it is possible hat valve operation torque gets increased, which should be taken into full consideration as selecting actuators.
Operation torque for metal to metal sealed floating ball valve is about 4 times that of soft sealed floating ball valve.

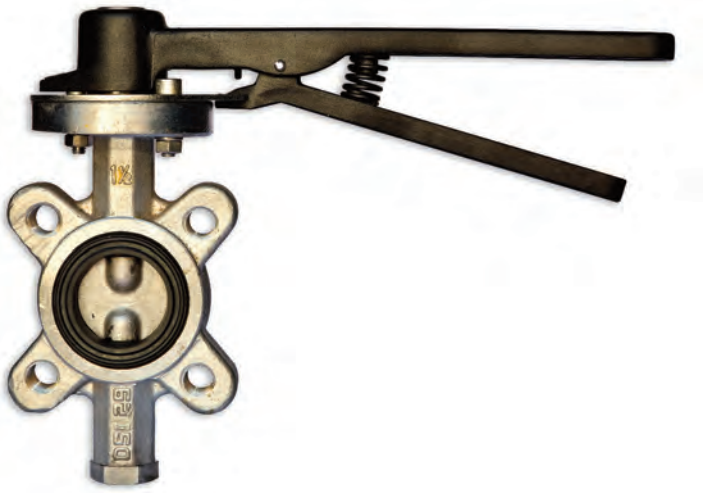
BUTTERFLY VALVE



Standards

Design and Manufacture comply to:	API 609, EN558-1, MSS SP 67
Inspection and Test comply to:	API 598
EFace to face dimension comply to:	BS5155
Flanges comply to:	API 605
Pressure temperature grade comply to:	ANSI B6.34

BUTTERFLY VALVE

Brief description

G.E.P. butterfly valves can be concentric, eccentric and triple eccentric type. Classified for stop type, adjust type and vent type, soft seal and metal seal. Liner material of soft seal butterfly valves, are suitable in EPDM, NBR, SI, VITON, PTFE based on different temperature and media. A wide range of butterfly valves are available such as wafer, lug, double flange, and not all of them are shown in this catalogue. Please feel free to contact us in case you should need any further information.

Butterfly valve design construction and specifications

G.E.P. cast butterfly valves comply to API 609, EN 558-1, MSS SP 67 standards. Pressure test is according to API 598 or ISO 5208.

Seat material and working temperature

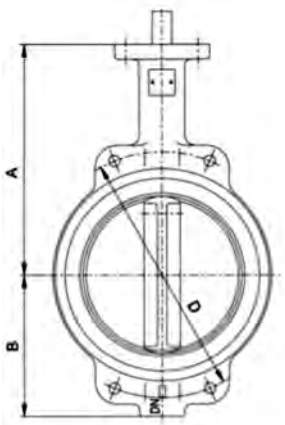
EPDM	-40~+125℃
NBR	-20~82℃
SI	-70~+150℃
VITON	-23~+150℃
PTFE	23~+150℃
316+Graphite	-46~+350℃
STL/STL	-46~+350℃

Pressure test

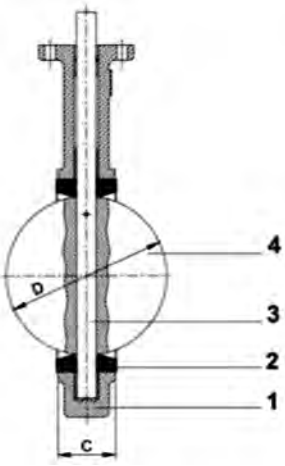
Class	Shell test (MPa)	Shell test (MPa)	Air test (MPa)
150Lb	3.1	2.3	0.5~0.7
300Lb	7.6	3.6	0.5~0.7
600Lb	16.0	11.0	0.5~0.7

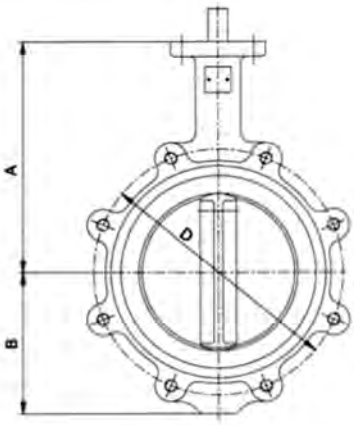
BUTTERFLY VALVE

Soft seal butterfly valve



Wafer type





Lug type

Technical requirements

1. Design and manufacture comply to API 609, EN 558-1
2. Inspection and test comply to API 598, ISO 5208
3. Face to face dimension complies to BS 5155, EN 558-1
4. Flanges comply to ANSI B16.5, UNI 2223
5. Pressure - temperature grade complies to ANSI B16.34

Soft seal butterfly valves can be operated by lever, gear operator or by actuator

MOTORIZATION

Motorization with pneumatic and electric actuators

All valves shown in this catalogue can be motorized. A wide range of actuator is available: electric type, Spring return and Double acting pneumatic type in different variation, such as Rack and Pinion, Scotch-joke and linear. Moreover sundries accessorizes can be installed as solenoid valve, limit switch box, filter regulator, pressure gauge, etc.
